

Animal Agriculture and Food Safety Risk Analysis and Disease Modeling

EpiX Analytics and RVC, London, UK, 2016

Course program

Please remember to review the basic study material provided [here](#) before attending the course

Five-day course:

Day 1	Introduction & Fundamental stochastic processes
<i>Morning</i>	<p>Welcome and General Introduction</p> <p>Introduction to risk analysis in epidemiology and food safety</p> <ul style="list-style-type: none"> • Frameworks (OIE, Codex) & principles • Qualitative, semi-quantitative and quantitative approaches • Risk management and risk communication <p>Short refresher: statistical foundations and risk modeling</p> <ul style="list-style-type: none"> • Fundamentals of probability distributions • Probability theory refresher • Graphical representations of risk events • Monte Carlo simulation, Excel add-ons (@RISK®) and R® • Calculation vs. simulation • Typical risk analysis results, their presentation and interpretation
<i>Afternoon</i>	<p>Fundamental stochastic processes: Binomial process</p> <ul style="list-style-type: none"> • Binomial & beta distributions - optional: BetaBinomial, negative binomial, and geometric • Practical problems to solve • Discussion / examples <p><i>Social event in Camden</i></p>
Day 2	Fundamental stochastic processes (cont.)
<i>Morning</i>	<p>Poisson process</p> <ul style="list-style-type: none"> • Poisson, gamma, exponential distributions - optional: Erlang, Polya, and Delaporte • Practical problems to solve <p>Central limit theorem</p> <p>Useful identities and approximations</p>

<i>Afternoon</i>	Determining distributions from data / distribution fitting <ul style="list-style-type: none"> • Checking data quality and appropriateness • How to accept and reject different data sets • How to use reported data in risk assessment models • Statistical methods to fit distributions to data • Combining data sources and/or expert opinion: mixture distributions and meta-analysis • Problems to solve
Day 3	Modeling parameter and model uncertainty
<i>Morning</i>	Bayesian statistics <ul style="list-style-type: none"> • Theory and derivation, comparison with classical statistical and Bootstrap methods <ul style="list-style-type: none"> ◦ Example: modeling p when no events are observed (zero-numerator) • Posterior construction and simulation <ul style="list-style-type: none"> ◦ Conjugate priors, discrete approximations, Bayesian Monte Carlo, MCMC, Likelihood-free methods (ABC) • Applied MCMC and WinBUGS/OpenBUGS modeling <ul style="list-style-type: none"> ◦ Example application: using latent-class analysis for imperfect diagnostic tests in a risk assessment model
<i>Afternoon</i>	Classical statistics <ul style="list-style-type: none"> • Using classical statistical inference and tests to model uncertainty about population parameters • Mean, SD/SE, prevalence, incidence • Limitations The bootstrap <ul style="list-style-type: none"> • Non-parametric and parametric Bootstrap techniques • Using the bootstrap to model correlations Applications and practical problems to solve
Day 4	Special topics in Epidemiology and Food Safety
<i>Morning</i>	Principles of food safety modeling <ul style="list-style-type: none"> • Farm to fork vs. empirical and risk attribution models • Exposure assessment – principles in microbial and chemical food safety, food consumptions databases and limitations Dose-response modeling <ul style="list-style-type: none"> • Mechanistic vs. “curve fitting” and empirical models • Single-hit vs. threshold models • Mechanistic models: Logistic, Exponential, Beta-Binomial, Beta-Poisson, Weibull-Gamma, Gompertz • Other empirical models • Low dose extrapolation and its limitations
<i>Afternoon</i>	Food safety modeling exercises Discussion of participants’ modeling problems <ul style="list-style-type: none"> • Example case studies / relevant methods Social event in Camden

Day 5	Disease spread modeling Designing, reporting and maintaining a risk assessment
<i>Morning</i>	Introduction to disease spread modeling <ul style="list-style-type: none"> • Dynamics of infectious diseases in populations, state transition diagrams, and basic disease parameters • Simple SIR and SEIR models • Extensions to the simple models: stochastic, spatially explicit models, multiple species/epidemiological populations • How to use disease spread models within a risk assessment • Practical problem: development of a stochastic model using Excel and @Risk and/or R
<i>Afternoon</i>	Model design and validation <ul style="list-style-type: none"> • Good practices in risk modeling: how to build and maintain a model (A-Z steps) • Risk analysis checklist, including common mistakes and their prevention Delivery of certificates of attendance and adjourn
